For effective zero-day threat protection, organizations need solutions, that feature malware-analysis technologies and can detect evasive advanced threats and malware - today and tomorrow. To protect customers against the increasing dangers of zero-day threats, SonicWall Capture Advance Threat Protection Service detects and can block advanced threats at the gateway until verdict. This service is the only advanced-threat-detection offering, that combines multi-layer sandboxing, combining full system emulation and virtualization techniques, to analyze suspicious code behavior. This powerful combination detects more threats, which are compute-environment specific and susceptible to evasion.

The solution scans traffic and extracts suspicious code for analysis, but analyzes a broad range of file sizes and types. Global-threat intelligence infrastructure rapidly deploys remediation signatures for identified threats to all SonicWall network security appliances, thus preventing further infiltration. Customers benefit from high-security effectiveness, fast response times and reduced total cost of ownership.

- High security effectiveness against unknown threats
- Near real-time signature deployment protects from follow on attacks
- Reduced total cost of ownership
